This invention relates to a sakuranetin synthetase gene encoding a protein with naringenin 7-0-methyltransferase (NOMT) activity and promoter activity. The invention includes a recombinant vector including the sakuranetin synthetase DNA and host cells transformed with the vector. The sakuranetin synthetase protein has antibacterial activity and is used to produce transgenic plants with antibacterial characteristics. The present sequence represents the sakuranetin synthetase gene of the
                                                                                                                                                                                                                     Sakuranetin synthetase gene encoding protein with naringenin 7-0-methyltransferase activity in rice cells and promoter activity, used to derive sakuranetin from naringenin easily in plants to impart antibacterial characteristics -

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 3,

/note="Vector::PT773D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NCI_CGAP_GG4 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 1469064-1470983, and 147592-1476743). Subtraction by Bento Soares and M. Fatima Bonaldo. "

Adams MD, Gene RESULT Q61275/

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The Expressed Sequence Tag was isolated from a human brain cDNA library as part of a large set of ESTS which can be used as markers for human genes transcribed in vivo. They can be used to facilitate tagging of most human genes, for mapping locations of expressed genes on chromosomes, for individual or forensic identification, for mapping locations of disease-associated genes, for identification of tissue type, and for prepn. of antisenes sequences, probes and constructs. EST01293 has a "poor" coding probability as evaluated using the coding-region prediction program CRM. See also 059041-061440.

Isolated polynucleotides, and encoded proteins, comprising secreted expressed sequence tags (sESTs), useful for treating various disorders such as autoimmune, infectious, and central nervous system disorders expressed

Claim 1; Page 612-613; 618pp; English.

Aut 261 to A43419 represent specifically claimed secreted expressed sequence tags (SESTS), isolated from human, mouse, xenopus and rat clasue sources. The SESTS can have a range of activities depending on the tissues they were isolated from The activities include: chemotactic; the tissues they were isolated from The activities include: chemotactic; antibacterial; antidiabetic; antiasthmatic; vulnerary; antidiabetic; antibacterial; antidiabetic; antiparkinsonian; antibacterial; catepopathic; neuroprotective; nootropic; antiparkinsonian; antibaciatic; osteopathic; neuroprotective; notropic; antidathmatic; vulnerary; antidicer; cerebroprotective; notropic; antidathmatic; vulnerary; antidicer; cerebroprotective; notropic antidaptics and antidabetic; antibactics; care useful as probes for the identification and isolation of full-length cDNAs and genomic DNA molecules which correspond to the SESTs. Proteins encoded by the SESTs are useful in assays for determining biological activity and raising antibodies. They may be useful for treatment of autoimmune disorders (arthubodies: They may be useful for treatment of autoimmune disorders (asthma), mysolod or lymphold cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (castma), mysolod or lymphold cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (clond mopholis), inflammatory disorders (clond mopholis), inflammatory disorders (clond coll deficiencies) and psoriasis. A43420 to A43425 represent linker variants which are central cycles of the present invention.

Isolated polynucleotides, and encoded proteins, comprising secreted expressed sequence tags (SESTs), useful for treating various disorders such as autoimmune, infectious, and central nervous system disorders

Claim 1; Page 450; 618pp; English.

rissue sources. The sESTs can have a range of activities depending on the tissues cheek solated from human, mouse, xenopus and rat tissue sources. The sESTs can have a range of activities depending on the tissues they were isolated from. The activities include: chemotactic; proliferative; immunomodulatory; heamatopoietic; chemokinetic; analgesic; heamostatic; thrombolytic; antinflammatory; cytostatic; antibacterial; antidiabetic; antibathactic; undinerary; antibucer; osteopathic; neuroprotective; noctropic; antiparkinsonian; antipactatic; carebopathic; neuroprotective; noctropic; antidepressant. The sESTs can be used for gene therapy and in vaccines. The sESTs are useful as probes for the identification and isolation of full-length cDNAs and genomic DNA molecules, which correspond to the SESTs. Proteins encoded by the SESTs of the identification and isolatical activity and raising antibodies. They may be useful for treatment of autoimmune disorders care useful an assays for determining biological activity and raising antibodies. They may be useful for treatment of autoimmune disorders (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (cathma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (Crohn's disease), tumours, bacterial, fungal or viral infections, depression and psoriasis. A43120 to A4312 rotay invention. A41261 to A43419 represent specifically claimed secreted expressed

The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula [(Glya)X(Glyb)Y(Glyc)Z]n where Glya, Glyb, Glyc are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66 X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid encoding the stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein. The products can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fusion protein; stabilising polypeptide; proteolytic degradation; resistence; half-life; autoimmune disease; inflammation; nitro drug: IkappaB regulator protein; inflammatory bowel disease; in vivo imaging: nitroreductase protein; enzyme therapy; prodrug therapy; protease;

```

The present sequence is that of DNA encoding the Epstein-Barr virus (EBV) nuclear antigen protein 1 (EBNA1, see Y95856). EBNA1 is stably unclear antigen protein 1 (EBNA1, see Y95856). EBNA1 is stably transfected with at least one episome. This method involves transfecting a eukaryotic cell with: (1) a first episome comprising a first protein whose expression results in cell death and a second expression results in cell death and a second protein where expression of the second protein prohibits the occurrence of cell death resulting from expression of the first protein to produce expression of the encoding a second protein where expression of the second protein prohibits the occurrence of cell death resulting from expression of the first protein to produce comprising an EBV orly and a gene encoding a second protein of the first protein to produce expression of the episomes by the cells. The doubly transfected cells which also express an antigen that promotes retention of the episomes by the marker is maintained. Cransfected cells are maintained under conditions in which the first and second proteins and the selectable marker is maintained. Under these conditions, only cells containing both episomes, and the protein of interest from the other episomes, and the epitopes may further comprise a nucleic acid sequence encoding a protein of interest from the other episome. Either or both epitopes may further comprise a nucleic acid encoding an RNA that is not intended to be translated (e.g. a therapeutic RNA), or a DNA sequence encoding as tagged or the cells. The method is applicable to cell culture or mittand establishment of eukaryotic cells that stably and reliably expressed agence of interest, using a novel method of selection, and establishment of evaluation without the need for exogenous Sequence 1926 BP; 487 A; 352 C; 872 G; 215 T; 0 other; selection factors, such as antibiotics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the Epstein Barr nuclear antigen. It is used to produce bait vectors of the invention. The specification describes a compositions and methods for a genetic system of detecting protein interactions in a mammalian host cell. The system comprises bait and test, both containing selection genes, and viral origin of replications which require bound viral replication proteins to effect replication the compositions is useful for detecting an interaction between a bait protein and a test protein. It is useful in a mammalian two-hybrid system for detecting protein interactions in a mammalian host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1163 ccctcagtcaccagctacaggcagaacacctgtgtttgtgagccccactccccacctcc 1222

plasmid pcwvBBNA from which Epstein Barr Virus Nuclear Antigen I (EBNA I) encoding DNA is obtained. EBNA I protein is used to stably maintain episomes containing EBV origin of replication (oriP) and a gene encoding protein or RNA of interest. Bucaryotic host cells expressing EBNA I protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy,
                                                                                                                                      sequence is an anti-sense strand of commercially available

This invention describes a novel method for generating an antisense library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. This sequence represents the vector pShuttle which is used in the method tocaccacctcttccatctgccttgtcaacttcctcattaagagcttcaatgacttcaac 1282 cocteagteaccagetacaggeagaacacetgtgtttgtgageeceaeteeceaetee 1222 Gaps for identifying antisense for antisense-mediated cecteetgecectectgetectgecectectgecectgetectgecectectgecec tectececetecagtacetececeaectecageceaetgetttgeaagetecage tectgecectectgecectectgecectectgecectectgetectgecectec tgoccetectgetectgecectectgetectgecectectgetectgecectectgetee tccaattgcacctcctctagtacagccctctccaccagtagctagagctgccccagtatg tycocottoctyccoctcottyccoctcottyctcottyccoctcottyccoctgo tyagactgtaccagttcatccactcccacaaggtgaagttcaggggctgcctccacccc tgecectectgecectgetectgecectectgetectgecectectgecectec Length 8705; ö Sequence 8705 BP; 1875 A; 2575 C; 2078 G; 2177 T; 0 other; Indels DB 20; Score 110.6; DB 20; Pred. bovine growth hormone polyA sequence, and a kanamycin resistance selectable marker. Polynucleotides encoding polypeptides, such as erythropoietin or leptin, and ribozymes and antisense polynucleotides can be inserted into the vector. The vector is polynucleotides can be inserted into the vector. The vector is perferred for use in novel compositions and methods for improved polynucleotide delivery into cells. In these methods, polycationic agents are used to increase the frequency of uptake of a nucleic acid (see also V2164-86) into a cell. The polycationic agent can condense with the nucleic acid and inhibit serum and/or nuclease degradation of the nucleic acid. The nucleic acid can be vector, may express a therapeutic protein or a vaccinating viral or cancer antigen, or is itself therapeutic (antisense or ribozyme). The methods and compositions can be used in the gene transpy of many diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1402

The cell is used to assay a test compound for its effect on a G_IPCR. The method and cells are useful for assaying agonist and antagonist compounds, which bind to G_IPCR which, stimulate intracellular calcium mobilization, such as the nociceptin receptor, and particularly chemokine receptors such as CCR3, cCR2 and the interleukin B receptor type B. The present sequence represents the nucleotide sequence of the pCEP4 vector.

                                                                                                                                                                                                                                                                                                                                   Plasmid pcisEBON (a pRK5 derivative) is an episomal CMV driven expression plasmid. HuGGF variants with enhanced receptor binding activity were produced by site-directed mutagenesis. Stable populations of preferred HGF variants were obtained by transfecting

This sequence represents the episomal CMV driven expression plasmid CC pCisEBON which was used in the expression of variant human hepatocyte pCisEBON which was used in the expression of variant human hepatocyte ciscopath factor (HGF). HGF is isolated from human serum and is a disulphide linked heterodimer derived by proteolytic cleavage of the pro-hormone between residues 494 and 495. This generates a molecule composed of an alpha subunit of 440 amino acids (mol. wt. 69 kD) and beta subunits are encoded by a single open reading frame. The alpha and beta subunits four Kringle domains based on their homology to kringle-like contains four Kringle domains based on their homology to kringle-like domains in other proteins, e.g. prothrombin, plasminogen. The beta subunit shows high homology to the catalytic domain of serine proteases contains which retain HGF. Therefore, the precise function of the beta chain remains unknown. The invention includes HGF serine proteases are not conserved in HGF. Therefore, the precise contains which retain HGF receptor binding activity without having the biological activity of wild-type HGF. They can be used for the treatment of pathological conditions associated with the activation of a HGF receptor such as malignancies associated with chronic HGF receptor activation. The proteins and proteins confined sequence and expression may be used for manipulation of the HGF coding sequence and expression confined the proteins. ö Human; hepatocyte growth factor; HGF; huHGF; serum; proteolytic cleavage; ppco hormone; beta subunit; alpha subunit; kringle domahn; prothrombin; plasminogen; catalytic domain; serine protease; HGF variant; HGF receptor; malignancy; chronic HGF receptor activation; ss. 2774 contragical accade tacad graduate and the state of the st 1343 agtaccaccacctccagctcctcttcagattgcccctggagttcttcacccagctcctcc 1402 Gaps New hepatocyte growth factor variants - are resistant to in vivo proteolytic cleavage into a 2-chain form, useful as HGF antagonists tecaccacetettecatetgeettgteaactteeteattaagagetteaatgaetteaac tectececetecagtacetececeaectecagetecagetetetgeaagetecage Length 10596; Sequence 10596 BP; 2627 A; 2571 C; 3023 G; 2375 T; 0 other; Indels pCisEBON for expression of hepatocyte growth DB 17; 4.2%; Score 110.6; DB 17; 50.7%; Pred. The specification describes a hepatocyte growth factor (HGF) variant (HGFV) comprising an amino acid (aa) alteration at or adjacent to position 692 of the wild-type human HGF (huHGF) as sequence. HGFV may be used in studies to identify the structure-activity relationships of HGF in order to identify the functionally important domains in the as sequence. It may also be used to identify as residues which are responsible for the interaction of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HGF with its receptor, and those as that are responsible for the biological activity of it. Variants of HGFV which have enhanced receptor biological affinity (compared to wild-type whuGF) and are more biologically active than wild type huHGF, may be used as huHGF agonists. Conversely, variants of HGFV which have enhanced receptor binding affinity (compared

malignancies associated with chronic HGF receptor activation.
HGFV-immunoglobulin chimeras may be produced (by standard methods) and used in protein A purification, immunohistochemistry, and immunoprecipitation techniques (in place of anti-HGF antibodies) or in screening studies to identify inhibitors of HGF-HGF interactions.
wild-type huHGF) but which are biologically inactive may be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tecaceacetettecatetgeettgteaactteeteattaagagetteaatgaetteaae 1282

```

retase; beta-amyloid precursor protein; beta-amyloid plaque component; Alzheimer's disease; amyloidogenic

```
The specification describes a beta-secretase enzyme. The enzyme cleaves beta-amyloid precursor protein to produce beta-amyloid peptide. This enzyme is therefore implicated in the production of amyloid plaque components which accumulate in the brains of individuals afflicted with Alzheimer's disease. Inhibitors of beta-secretase are administered to a mammalian subject e.g. with Alzheimer's disease or Alzheimer's disease. Inhibitors of beta-secretase are administered to a mammalian subject e.g. with Alzheimer's disease or Alzheimer's ability or reduce the plaque burden. The compounds are used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease. The present sequence encodes a human beta-secretase enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10642 tectgetectgecectectgecetectectgetectgecectectgecectectge 10701

The present sequence is one of a large number of 5' ESTs derived from manas encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                            Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
